

# Managed Meraki

## Simplifies and secures the local network with quality and visibility

**PlanNet21's Managed Meraki, powered by Conscia is a cloud-based service for implementing and managing local networks, both wired and wireless.**

In addition to basic network functionality, the service focuses on security, quality, visibility and full traceability to ensure that all devices and users are given a quality connection to the network.

With Managed Meraki, an optimal connection is ensured for all units of the business within the business premises and locations, for example for offices, shops and warehouses.

The service ensures a safe and stable function and simplifies the installation, expansion and replacement of switches and access points, while the service ensures that all devices and users are given a quality connection to the network.

## How it works

The service is modular and adapts to the business's specific needs by selecting the appropriate switches and/or access points. This ensures secure and reliable connectivity for all devices on-site.

- Switches are chosen based on port count, Power over Ethernet (PoE), and stacking needs.
- Access points are selected for coverage, indoor/outdoor use, and other requirements.
- Flexible design tailored for various environments: office, home office, shared spaces, warehouses, and industrial applications.

This adaptability makes the service suitable for any type of business setting.

### Price

The price for Managed Meraki is based on multiple variables in your IT environment. Please contact us for a quote.
